

Find the measure of  $\angle x$ .<sup>1</sup>

(1):  $AB = AC$ ,  $L//M$

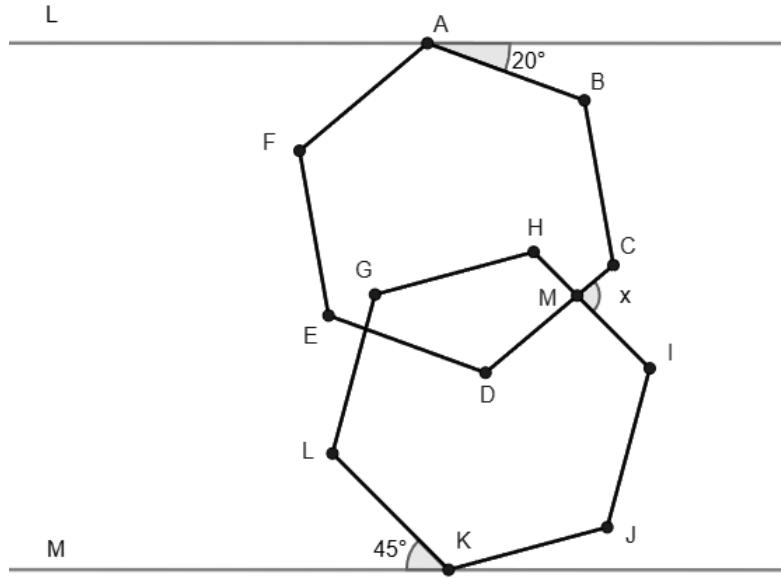

(2):  $CD//L$ ,  $\angle DEF = 90^\circ$

<sup>1</sup>(1) Hosei University High School, Tokyo, (2) Ikubunkan High School, Tokyo, (3) Rakunan High School, Kyoto

(3):  $L//M$ , both hexagons are regular hexagons.

Hint: Draw an auxiliary line and extend some of the sides of the hexagons.

## Solution

Answer : (1) :  $15^\circ$ , (2) :  $28^\circ$ , (3) :  $85^\circ$

Proof (1): Triangle  $ABC$  is an isosceles triangle, with sides  $AB=AC$ , so  $\angle C = (180^\circ - 20^\circ) \div 2 = 80^\circ$ . Drawing an auxiliary line through point  $C$ , we can derive that  $\angle x + 65^\circ = 80^\circ$ , giving us  $\angle x = 15^\circ$ .

Proof (2): Extend segment  $ED$ , creating point  $G$ , the intersection with line  $L$ . Since  $CD//L$ ,  $\angle x = EGF$ . Also, we know that  $\angle x + \angle EGF = 118^\circ$ , giving us  $\angle x = 28^\circ$ .

Proof(3): Refer to diagram below. Draw an auxiliary line through point  $M$ , and extend sides  $BC$  and  $IJ$ . Make the intersection of the extended sides  $BC$  and  $IJ$  with the auxiliary line points  $N$  and  $O$ , respectively. We know that an interior angle of a regular hexagon is  $120^\circ$ , so each exterior angle of a regular hexagon is  $60^\circ$ .  $\angle CNO = 180^\circ - 20^\circ - 60^\circ = 100^\circ$ .  $\angle MCN = 60^\circ$ . Therefore,  $\angle CMO = 100^\circ - 60^\circ = 40^\circ$ . Opposite angles of a parallelogram are congruent, so  $\angle MOI = 75^\circ$  and  $\angle MIO = 60^\circ$ . Also,  $\angle IMO = 180^\circ - 75^\circ - 60^\circ = 45^\circ$ . Therefore,  $\angle x = \angle CMN + \angle IMO = 40^\circ + 45^\circ = 85^\circ$ .
